

## Software Application li02 (Sensing + limit switch)

for sensors, model LI04, LI65 and LDF (FT-X1 transformer / FT3120 transceiver)

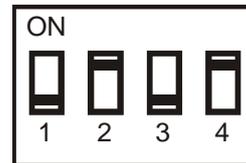

Application for measuring of light intensity, evaluation of two limit switches as well as data output. The prescriptions of LonMark<sup>®</sup> function profile 1010 are observed.

**Measuring ranges:** The light sensor disposes of measuring ranges 0 - 2.000 lux, 0 - 20.000 lux and 0 - 65.535 lux. The measuring ranges are selected via the DIP-switch at the device and via configuration parameter nciMeasureRange.

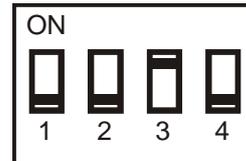

**DIP 1 - 3:**  
Measuring range: 0 - 2.000 lux

**DIP 4 = ON:**  
=> Sensor model: LDF

**DIP 1 - 3:**  
Measuring range: 0 - 20.000 lux

**DIP 4 = ON:**  
=> Sensor model: LDF

**DIP 1 - 3:**  
Measuring range: 0 - 65.535 lux

**DIP 4 = OFF:**  
=> Sensors model: LI04, LI65

**Output variables:** The measured light value is output by the variables type SNVT\_lux, SNVT\_lev\_percent and SNVT\_count.

**Calibration:** By means of an external luxmeter the exact light intensity can be detected and input via the parameter nciFieldCalibr. The reflection factor is calculated automatically and both the measured and the final value of the measuring range are corrected, accordingly.

**Limit switch:** The Limit Switch Object offers the possibility to configure an upper and lower limit switch via a hysteresis value and delay times. The limit switches can be activated respectively deactivated by the input variables nviEnableLim\_sw/\_oc. Thereby the possibility is given to connect the function with a LON-occupancy sensor.

## Node Object

The Node Object supervises and controls the functions of the individual objects within the unit. The basic functions required by the LonMark<sup>®</sup> are supported.

### Network Variables Node Object:

#### nviRequest

SNVTType: SNVT\_obj\_request, Index 92

Function: Input variables with functions RQ\_NORMAL, RQ\_UPDATE\_STATUS and RQ\_REPORT\_MASK.

#### nvoStatus

SNVTType: SNVT\_obj\_status, Index 93

Function: Output variable including required status bits „invalid\_id“ and „invalid\_request“.

### Configuration Parameter Node Object:

#### nciLocation

SCPTType: SCPTlocation, Index 17, SNVT\_str\_asc

Function: Additional input possibility to store information for identification of position.

## Light Sensor Object

Object includes functions for measuring of light intensity and data output.

### Network Variables Light Sensor Object:

#### nvoLuxLevel

SNVTType: SNVT\_lux, Index 79

Function: Output variable for measured light intensity in Lux. Data output is made depending on configuration parameters nciMinSendtime\_L, nciMaxSendtime\_L and nciMinDelta and 3 s and after reset.

#### nvoLuxLevPercent

SNVTType: SNVT\_lev\_percent, Index 81

Function: Output variable for measured light intensity in % from the measuring range. Data output is made analog to nvoLuxLevel.

#### nvoRawHwData

SNVTType: SNVT\_count, Index 8

Function: Output variable for measured light intensity as direct measuring result of 12-bit AD-converter. Data output is made analog to nvoLuxLevel.

### Configuration Parameter Light Sensor Object:

#### nciFieldCalibr

SCPTType: SCPTfieldCalib, Index 90, SNVT\_lux

Function: Configuration parameter for self-calibration of light detector. Exact light intensity can be detected and stored via an external Luxmeter. The reflection factor is calculated automatically and the measured value is corrected, accordingly. (Preset value: 0 Lux ==> Field calibration deactivated)

#### nciMaxSendtime\_L

SCPTType: SCPTmaxSendTime, Index 49, SNVT\_time\_sec

Function: Heartbeat function. Stipulates interval period after which light intensity is sent independent on result changes. By means of the input values < 1 sec. the heartbeatfunction is deactivated. (Preset value: 60 sec.)

#### nciMinSendtime\_L

SCPTType: SCPTminSendTime, Index 52, SNVT\_time\_sec

Function: Stipulates the smallest update-interval of output variables. An update is made after expiration of „nciMinSendtime\_L“, if the light value has changed by more than „nciMinDelta“. Minsend function is disabled with input value < 1 sec. (Preset value: 1 sec.)

**nciMinDelta**

SCPTType: SCPTminDeltaLevel, Index 88, SNVT\_lev\_cont

Function: If light intensity changed by „nciMinDelta“ (% from current measuring value), the new values are transmitted. Function depends on adjustment of „nciMinSendtime\_L“.  
(Range: 0 % - 100 %; preset value: 5 %)

**nciMeasureRange**

SCPTType: SCPTmaxRnge, Index 20, SNVT\_lux

Function: Configuration parameter for software set-up of measuring range. When using the configuration parameter nciFieldCalibr, the measuring end point values are corrected by the calculated reflection factor.

**!! The set value must be in accordance with the adjustment of the DIP switches on the light sensor.**

Measuring range 0 -2000 lux  $\Rightarrow$  DIP1 = ON, DIP2 = OFF, DIP3 = OFF  $\Rightarrow$  nciMeasureRange = 2000

Measuring range 0 -20000 lux  $\Rightarrow$  DIP1 = OFF, DIP2 = ON, DIP3 = OFF  $\Rightarrow$  nciMeasureRange = 20000

Measuring range 0 -65535 lux  $\Rightarrow$  DIP1 = OFF, DIP2 = OFF, DIP3 = ON  $\Rightarrow$  nciMeasureRange = 65535

With final input, the output value nvoLuxLevel is set = 0.

**Limit Switch Object**

Object includes function for evaluation of two limit switches which can be configured via hysteresis values and delay periods.

**Network Variable Limit Switch Object:****nviEnableLim\_sw / nviEnableLim\_oc**

SNVTType: SNVT\_switch, Index 95 / SNVT\_occupancy, Index 109

Function: Input variables for deactivation of limit switches. Thereby, it is possible to connect the function of limit switch to a LON- occupancy sensor.

Limit switch activated: nviEnableLim\_sw = 100.0 1 AND nviEnableLim\_oc = OC\_OCCUPIED

Limit switch disabled: nviEnableLim\_sw = 0.0 0 OR nviEnableLim\_oc  $\neq$  OC\_OCCUPIED

Initialization values after reset: 100.0 1 and OC\_OCCUPIED, i.e. limit switches are activated.

**nvoLuxValue**

SNVTType: SNVT\_lux, Index 79

Function: Output variables for measured light intensity in Lux  
Data output is made analog to nvoLuxLevel.

**nvoLowLimSwitch**

SNVTType: SNVT\_switch, Index 95

Function: Output variable of limit switch for lower limit value.

If the the lower limit (nciLoLimit - nciLoLimHyst/2) is not reached for a time being „nciLoLimOnDelay“ nvoLowLimSwitch = 100.0 1 is automatically set.

If low limit (nciLoLimit + nciLoLimHyst/2) is exceeded for a time being „nciLoLimOffDelay“, nvoLowLimSwitch = 0.0 0 is set.

Data output is effected upon change of output value, depending on nciHeartbeat and approx. 3 sec. after reset. (For status changes and output variables please refer to function diagram).

**nvoHighLimSwitch**

SNVTType: SNVT\_switch, Index 95

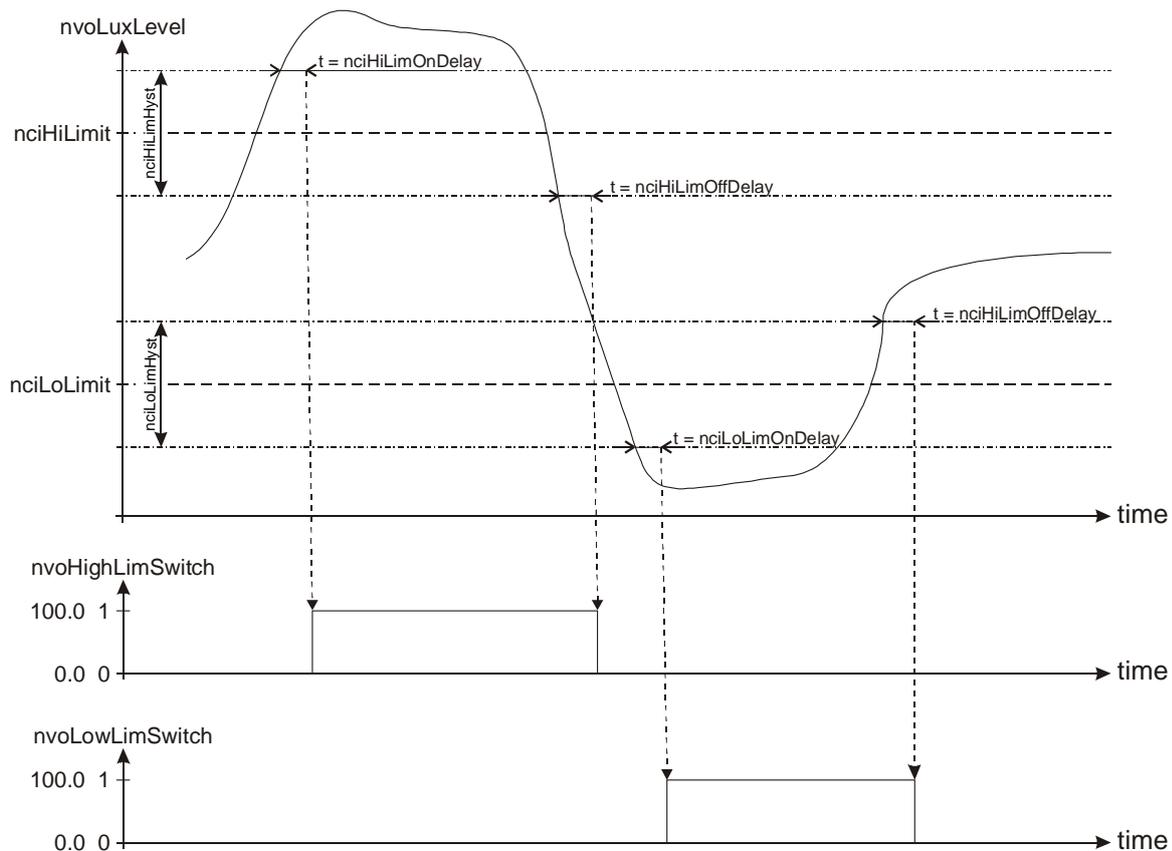

Function: Output variable for high limit switch.

If upper limit (nciHiLimit + nciHiLimHyst/2) is exceeded for a time being „nciHiLimOnDelay“ nvoHighLimSwitch = 100.0 1 is set.

If upper limit (nciHiLimit - nciHiLimHyst/2) is not reached for a time being „nciHiLimOffDelay“ nvoHighLimSwitch = 0.0 0 is set.

Data output is effected upon change of output value, depending on nciHeartbeat and approx. 3 sec. after reset. (For status changes and output variables please refer to function diagram).

## Function Diagram Limit Switch

## Configuration Parameter Limit Switch Object:

### nciLoLimit

SCPTType: SCPTlowLimit1, Index 18, SNVT\_lux

Function: Lower limit (Range: 0 - max. measuring range [lux], preset value: 0 lux)

### nciLoLimHyst

SCPTType: SCPTThystLow1, Index 13, SNVT\_lux

Function: Hysteresis value for calculation of lower switching steps.  
(Range: 0 - max. measuring value [lux], preset value: 0 lux)

### nciLoLimOnDelay

SCPTType: SCPTclOnDelay, Index 86, SNVT\_time\_sec

Function: Switch-on delay for lower limit switch `nvoLowLimSwitch`.  
(Range: 0 - 6553 sec., preset value: 0 sec.)

### nciLoLimOffDelay

SCPTType: SCPTclOffDelay, Index 85, SNVT\_time\_sec

Function: Switching-off delay for lower limit switch `nvoLowLimSwitch`.  
(Range: 0 - 6553 sec., preset value: 0 sec.)

### nciHiLimit

SCPTType: SCPTHighLimit1, Index 9, SNVT\_lux

Function: Upper limit switch  
(Value range: 0 - max. measured value [lux], preset value: 2000)

### nciHiLimHyst

SCPTType: SCPTThystHigh1, Index 11, SNVT\_lux

Function: Hysteresis value for calculation of upper switching steps.  
(Range: 0 - max. measured value [lux], preset value: 0 lux)

**nciHiLimOnDelay**

SCPTType: SCPTclOnDelay, Index 86, SNVT\_time\_sec

Function: Switch-on delay for upper limit switch nvoHighLimSwitch.  
(Range: 0 - 6553 sec., preset value: 0 sec.)

**nciHiLimOffDelay**

SCPTType: SCPTclOffDelay, Index 85, SNVT\_time\_sec

Function: Switch-off delay for upper limit switch nvoHighLimSwitch.  
(Range: 0 - 6553 sec., preset value: 0 sec.)

**nciMaxSendtimeSW**

SCPTType: SCPTmaxSendTime, Index 49, SNVT\_time\_sec

Function: Heartbeat interval. After expiration of time nciMaxSendtimeSW the output variables nvoHighLimSwitch and nvoLowLimSwitch are transmitted.

Heartbeat function is disabled with input values < 1 sec. (preset value: 0 )

**General Remarks:****Wink - Event**

Service LED is tripped and blinked two times.

**Configuration Parameter:**

A download of application overwrites manufacturer's configuration parameters.

Configuration parameters are designed as configuration network variables and are also available as bindable network variables within the virtual functional block. Thus parameter changes are possible even without installation tool via a different LON node.

**!! An update of variables is directly written into the non-volatile memory of hardware. User has to make sure !! that total number of writing cycles does not exceed maximum capacity of non-volatile !! memory (dimension <10000).**
